genetic background, important characteristics. Strain of origin for all strains: FGSC# A733

New mutants are mapped by haploidization of well-marked heterozygous 2n and crossovers for mutations located on the same chromosome are rare; however, in A. niger, they are more frequent than in A.nidulans.

COMMENTS (special growth requirements, aberrations, heterokaryon compatibility, special uses of strain, etc.)

As described by Debets et al.1993 (see above, & 1990, Mol. Gen. Genet. 221: 453-458) haploid crossover segregants are often found in A. niger, especially for mutations that map on opposite chromosome arm. This strain is a useful mapping strain which grows well on standard CM (addition of MET may improve conidiation).
