

A1089 21 WIM 027 mm + green normal pre-1; ve+ The original BB142 precocious competence strain described by Axelrod in 1973. It's conidiation cycle is normal, but it becomes competent 1-2 hours earlier. Keep it. I have no idea how to work with it, but it's an important rhythm mutant.

A1090 45 TU 138 Met,Bi + green normal I think this is Hyung-Ok's fluG701 suppressor. I'll have to check her thesis. Remind me about this.

22 WIM 028 mm X pre-1; pre-2; ve+ Too bad. This was BP3, the precocious double mutant isolated by Myra Kurtz in 1977.

A1092 46 TU 139 Met,Bi + green normal Same as TU138. I think. Also remind me to look into this.

A1093 23 WIM 064 Paba + yellow normal yA2 pabaA1; veA1 The R21 strain from Ron Morris who got it from Clive Roberts. This is one of the "biblical" A. nidulans lab strains. Almost everything comes from here.

A1094 24 WIM 065 Pyro + white normal wA3; pyroA4; veA1 The R153 strain from Ron Morris who got it from Clive Roberts. Also a "biblical" strain.

A1095 43 TU 130 Paba,Pyro,Trp + yellow normal yA2; pabaA1; delta-argB::trpC+; pyroA4; trpC801(?); ve+
