**Attachments:** SO451 and SO452.doc

Hi Kevin,

I am sending the more correct genotypes for S0451 and S0452 as a Word document so the formatting is correct. <sup>A1166 A1167</sup> Aysha had indicated arbB2 in brackets because the strains do carry argB2 but they are argB+ because the nkuA(ku70) gene is deleted with argB. She had also put chaA1 fwA1 in brackets because these color markers are epistatic to the wA3 white marker. So although there are several color markers the strain is white.

I have remove the brackets and given the correct genotypes in the Word document attached.

I have asked Aysha to send silica stocks as she is leaving the country tomorrow and will not be able to grow up the strains and then send. Silica is our usual way to send strains and I hope this will be OK. She will also put some on plates to confirm the silica is OK and I will let you know that they grow.

Best Wishes for the Holidays and the New Year!!

Thanks,

Steve
