*this is not a mutant allele, but a wild-occurring variant allele recognized by electrophoresis, present in Mauriceville-1cA F95c 2225*

Dear David,

I have been going through our files and weeding-out some of the old correspondence to make room for our current letters and came across a stock called leu-5<sup>M</sup>, which Sam Gross stated, in his letter of Oct. 4, 1978, "is listed under the Mauriceville stocks in the collection."

My question is should we list the leu-5 45208 A and a, stock numbers 939 and 340 as leu-5 45208(t) or not? In your compendium you have the allele listed as 45208t. See deposition sheet, copy, enclosed which brought about this question/s.

*Yes*

Is either of these temperature-sensitive stocks -- the leu-5 or the Mauriceville stocks? How should we list them in the next revision?

Sorry to bother you about these problems but am trying to tie-up some of the loose ends before I retire, either completely or part-time, not sure which I will do yet.

Best to you and Dot and the rest of the crew at the lab.

*Rich*

*I suggest*

leu-5<sup>M</sup> (not auxotroph) #2225
