

The sensitivity to arginine may be altered genetically or physiologically.
agg was first induced in arg 5, arg-8 A and was extracted by crossing the derived triple with 73a. The agg single mutant was then crossed to 73a, the "b₁" to 74A, and the "b₂" to 74A. The stock sent to you is ~~the~~ reisolato 3 (R3) of the third backcross (b₃). (Backcross refers to a cross with either 73a or 74A).
