

Craig W.

For your information.

6 July 1993

TO: Those concerned with *tol*.

John Leslie tells me that both FGSC stocks of *tol-1 trp-4* (2336, 2337) differ from Oak Ridge at each of two *het* loci -- *het-6* and *het-9*. 2336 (A) is *het<sup>OR</sup>* at the other 7 *het* loci. [2337(a) hasn't been tested for *het* loci other than -6 and -9.] The information comes out of a study, soon to be written up, showing that *tol-1* (N83) suppressed *het* incompatibility only for mating type and not for any of the other known *het* loci.

It had been shown in the 1970 Newmeyer paper that *tol* stocks from which 2336 and 2337 were derived differed in *het* genotype from OR, but it hasn't been known till now what loci are responsible.
