Fungal Genetics Stock Center  
Stock #4250

The culture sent to us 12-82 did not cross to N. crassa testers. It did not cross to N. sitophila a; however, it was very fertile crossed to N. sitophila A. There are many asci with eight black ascospores, making it almost certain that this is N. sitophila. Also there are many asci with eight white ascospores, suggesting that it may carry a reciprocal translocation with respect to our standard tester.
