Dear Kevin:

I am sending 9 strains of *Neurospora crassa* for possible addition to FGSC.

These include two new mutants (1) *pco-1* and (2) *nit-10* (not present now in FGSC)

Also, you'll find a temperature sensitive revertant of *cys-3* (*cys-3* REV 65) which, hopefully, is still viable. It is useful because of its ts property.

I also include several RIP mutants that are new null alleles of several well studied nitrogen-related structural and regulatory genes. Mutants of these are already in FGSC although these new RIP mutants might be useful since they have a complete loss-of-function (null). You may or may not want to add them.

These are (1) *nit-2* (N-regulatory) (2) *nit-3* (nitrate reductase) and (3) *nmr* (N-regulatory)

Sincerely,

George Marzluf
