Hello FGSC -

I am one of the members of the team sequencing the genome of the basidiomycete Amanita thiersii. The genome sequencing is being done at JGI. I would like to deposit the monokaryotic strain Amanita thiersii SKay4041 (the strain being sequenced at JGI) at the FGSC.

I will be sending along a culture of Amanita thiersii SKay4041 with the attached Deposit Form. The culture will ship the week after Thanksgiving. Please let me know if you have any problems with the culture or any questions.

Thanks,

Ben

Thank you.

Any information you can provide on culture or preservation of this species would be valuable, as would reprints of publications describing the strain.
