

All strains grow on standard Vogel's medium without any selection, but were inoculated directly from my primary transformant selection plates. NCAL001 – NCAL003 can do with an extra 1-2 days somewhere warm and sunny as I've just inoculated them today.

I've send all this in electronic form already, including plasmid maps and sequences, and the VectorNTI data base files. Please add them on the webpage.

I hope this information is complete and useful, otherwise please send me a mail and I'll do my best to sort things out.
