

→ The resulting transformants were crossed to WT, A (FGSC# 2489) to generate haploids & eliminate the mus51 background. Resulting strain was PCR-genotyped and tested to be hygromycin resistant & sensitive to glycerol-aminoglycoside (200 µg/ml). Mating type was tested on fluffy plates.

Reason: FGSC# 21118 & 21119 (the original  $\Delta$ NCU0876.2 strains) could not be successfully PCR genotyped!
